Lets say you need electricity for your home

You have 2 options

You can generate your own electricity, by setting up a lot of Infrastructure

*costing a lot of money*

Purchase it from electric power companies , already having the infrastructure

*pay as we use*

Obviously you would choose the 2nd  
**pay as you go** model

Wouldn't that decision be the same if someone  
provided all the necessary **cloud computing**  
**services** in one place

That is **AWS**

AWS is one of the **cloud computing providers** that provide us computing, storage, networking and lot more services that we can **pay as we use**

Simplified implementation, high **security**, **elasticity**, **scalability**, and **flexibility** are some of the known advantages of AWS

Lets look at few Services  
provided by AWS

# Amazon S3 (Simple Storage Service)

Storage service where we can store objects like files, folders, images, documents, songs...

backups

stores data

shares files

storage domain

## Amazon Elastic Cloud Compute (EC2)

These are the virtual machines in the cloud on which you have the OS level control

Amazon  
**EC2**

Build and Maintain  
Virtual Servers

Security, Storage,  
Scalability

compute domain

# Amazon Virtual Private Cloud (VPC)

Data center in the cloud in which you deploy all your resources

isolated virtual  
network

security,  
risk free

Networking domain

# AWS Lambda

AWS's serverless technology that allows you to run functions based on pay as you use model
