

Disadvantages of **REACT**

Brought to you by
[@gulraizcodes](#)

 **SAVE THIS**
for later

Like any other technology, REACT has its **own flaws** which are decreasing with the **passage of time**.

Just know the limitations and you're good to go.

Narrow Focus on UI

REACT is a **UI library**, therefore provides only the view part of the **MVC model**. When building something it, you'll have to **include other libraries** to handle other parts of an application.

High Development Pace

It is new and evolving. Its hard to keep the pace because new features coming out and old features will be useless.

Documentation Quality

Well, for some people Documentation is poor, but other developers like it. One of the reason behind improper documentation is its updates. REACT evolution is so fast.
